

SECURE P2P ECDN FOR SAFE VIDEO DELIVERY

STRIVECAST SECURITY FEATURES AT A GLANCE

The StriveCast eCDN optimizes video delivery within your organization so that you can reach all your employees, partners, or customers without crashing your network. While doing so, you don't want to throw your security standards overboard.

The StriveCast eCDN is used by many organizations that attach great importance to security like banks, insurances, and pharma groups.

Full GDPR compliance

StriveCast is a European company with headquarters in Duesseldorf, Germany. We fully comply with EU regulations concerning data protection, as well as with digital rights management.

100% Encrypted

All data is 100% TLS encrypted when exchanged and only decrypted at the end device.

Hosting: Cloud or On-Premise

Choose whatever fits best for your business: StriveCast runs in the cloud or within your private network to ensure maximum data privacy & control. We extended the on-premise installations with fallback security by allowing the configuration of a second Peering Manager.

Works with mDNS

You do not need to deactivate your security features to activate our solution – our eCDN is fully mDNS compatible without the need for local agents or other client software.

Compatible with VPN

StriveCast offers VPN detection methods, allowing you to exclude VPN users from peering. This way, video data is distributed most efficiently and does not interfere with your VPN policy.

Application & Interface Security

StriveCast's web application is only available via HTTPS and we manage access by a strict role-based system. Also, StriveCast passed a penetration test in 2021, carried out by one of the world's largest banking groups which included a series of attacks, impersonating a hypothetical aggressor.
